

## Javascript Building Blocks - Lesson 1: JS Include File and Browser development console

### Key notes to remember

1. Each browser will have a development console. For example, with Google Chrome, press Control+Shift+J to open it.
2. Inside the development console you can run Javascript statements by typing as many lines of code as you like by pressing Shift-Enter to move to each new line. Once ready to run all of the lines just press Enter.
3. Javascript can be written in the HTML file but best practice is to keep it in a separate file and include it in your HTML file using a script statement in the Head element.
4. The script statement is `<script src="some/path/someScript.js"></script>`
